M3 - Overview

Introduction

In this module, we explore the classification of plants,. We explore the separation of plants into four phyla and their characteristics. Then delve into the structural adaptations and function leading to increased diversity among the plants

---

Module Learning Objectives (MLOs)

The following MLOs support the **course learning objectives (https://fgc.instructure.com/courses/23434/pages/objectives-2)** .
By the end of the module, you will be able to:

1. Outline the key evolutionary innovations of plants.
2. Compare the structural, physiological, and reproductive adaptations that allowed plants to successfully survive a transition from water to land.
3. Explain the importance of the interaction of plants and fungi, providing evidence for the evolutionary, symbiotic relationship of fungi and plant roots (mycorrhizae).
4. Compare and contrast monocot versus eudicots
5. Identify the tissue type and function in each zone of a root
6. Identify stem, leaves and root diversity

Module Topics

- Plantae evolution and adaptations
- Plant cell, tissues, and organs
- Diversity and Organization of roots, stems, and leaves
