M5 - Overview

We start off this unit exploring plant responses and reproductive strategies We explore environmental changes and the effect they have the habitat.

Module Topics

- Plant Hormones
- Plant Growtth
- Plant responses to stimuli.

Module Learning Objectives (MLOs)

By the end of the module, you will be able to:

1. Identify the roles of hormones when plant cells utilize signal transduction to respond to environmental cues.
2. Compare and contrast the effects of the hormones on plant growth and development
3. Describe types of tropism and how the plant responds to the stimulus.
4. Describe circadian rhythms and their connection to phytochrome
5. Identify the key components of the flowering plant life cycle.
6. Recognize the functions of the key flower parts.
7. Compare the male and female gametophyte of flowering plants.
8. Describe the stages of eudicot development and Explain the sequence of events during seed germination..
9. Identify the asexual methods of reproduction in plants
